

Assembly Instructions

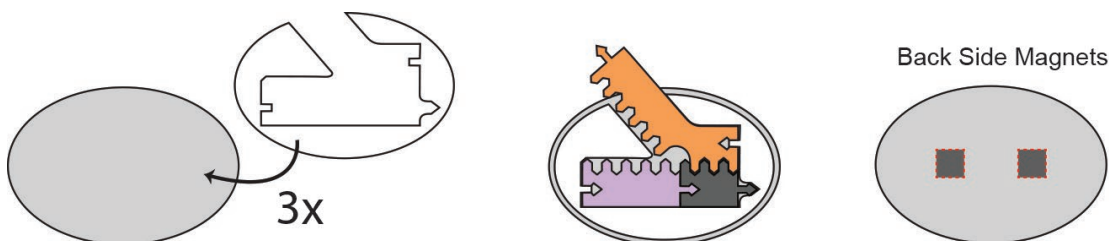

3x Bacteriophages

Three bacteriophages are assembled from a bottom foam piece, a top foam piece with an adhesive back and a chanel stem (pipe cleaner). Optional square magnets can be attached to the back of each bacteriophage, as shown below to the right, if you wish to display them on a magnet board.

3x Cas9 Proteins

Three identical Cas9 proteins are assembled from a gray bottom foam piece and a white top foam piece with an adhesive back. **Note that the white piece should be positioned carefully so that there is room to fit the guideRNA pieces, as shown below in the middle.** Optional square magnets can be attached to the back of the Cas9 protein, as shown below right, if you wish to display them on a magnet board.

Other Components

The remaining kit components do not require assembly, unless you choose to apply the optional square magnets so you can display them on a magnet board. Note that the magnets should be attached to the correct side of the foam, as shown in the graphic to the right.
